Client & Project Tracker

A full-stack web app that helps freelancers keep track of clients, deadlines, progress and payments.

React · Vite · Node.js · Express · REST API · PostgreSQL · Prisma · Neon · Vercel · Render

Live demo: project-tracker-eight-snowy.vercel.app

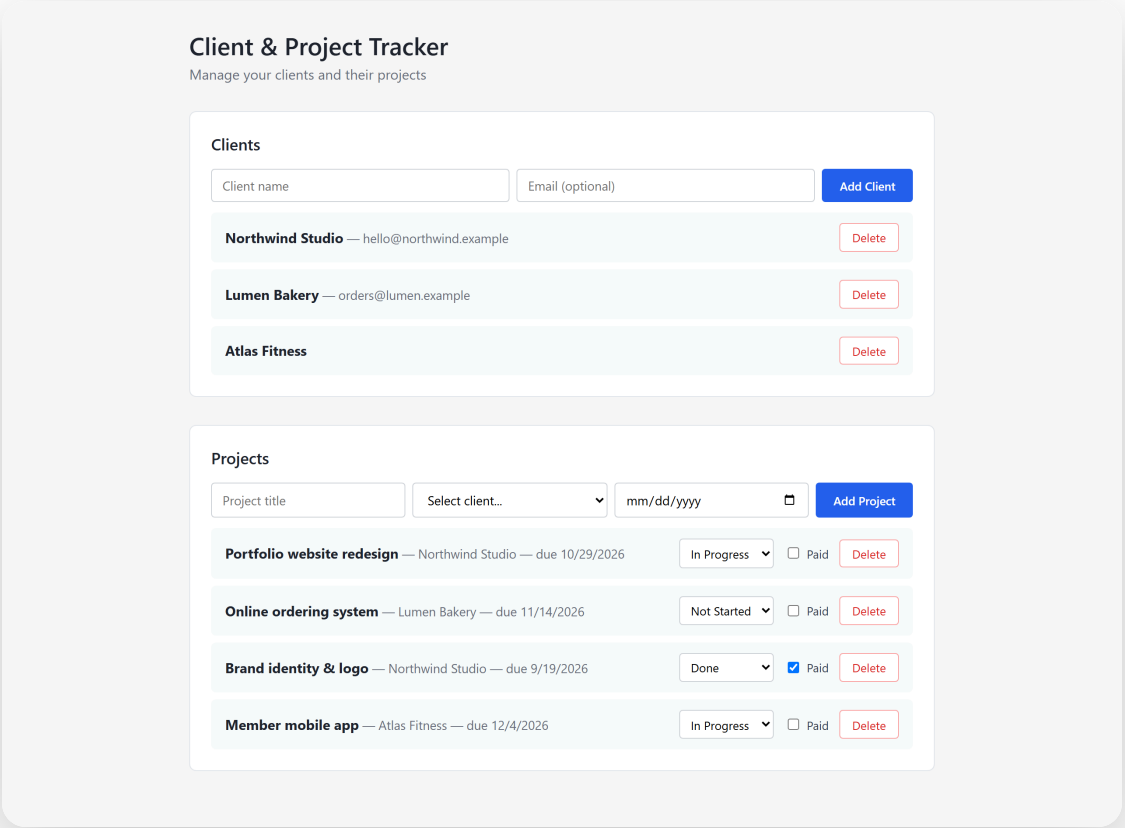

Code: github.com/Gudagit/project-tracker

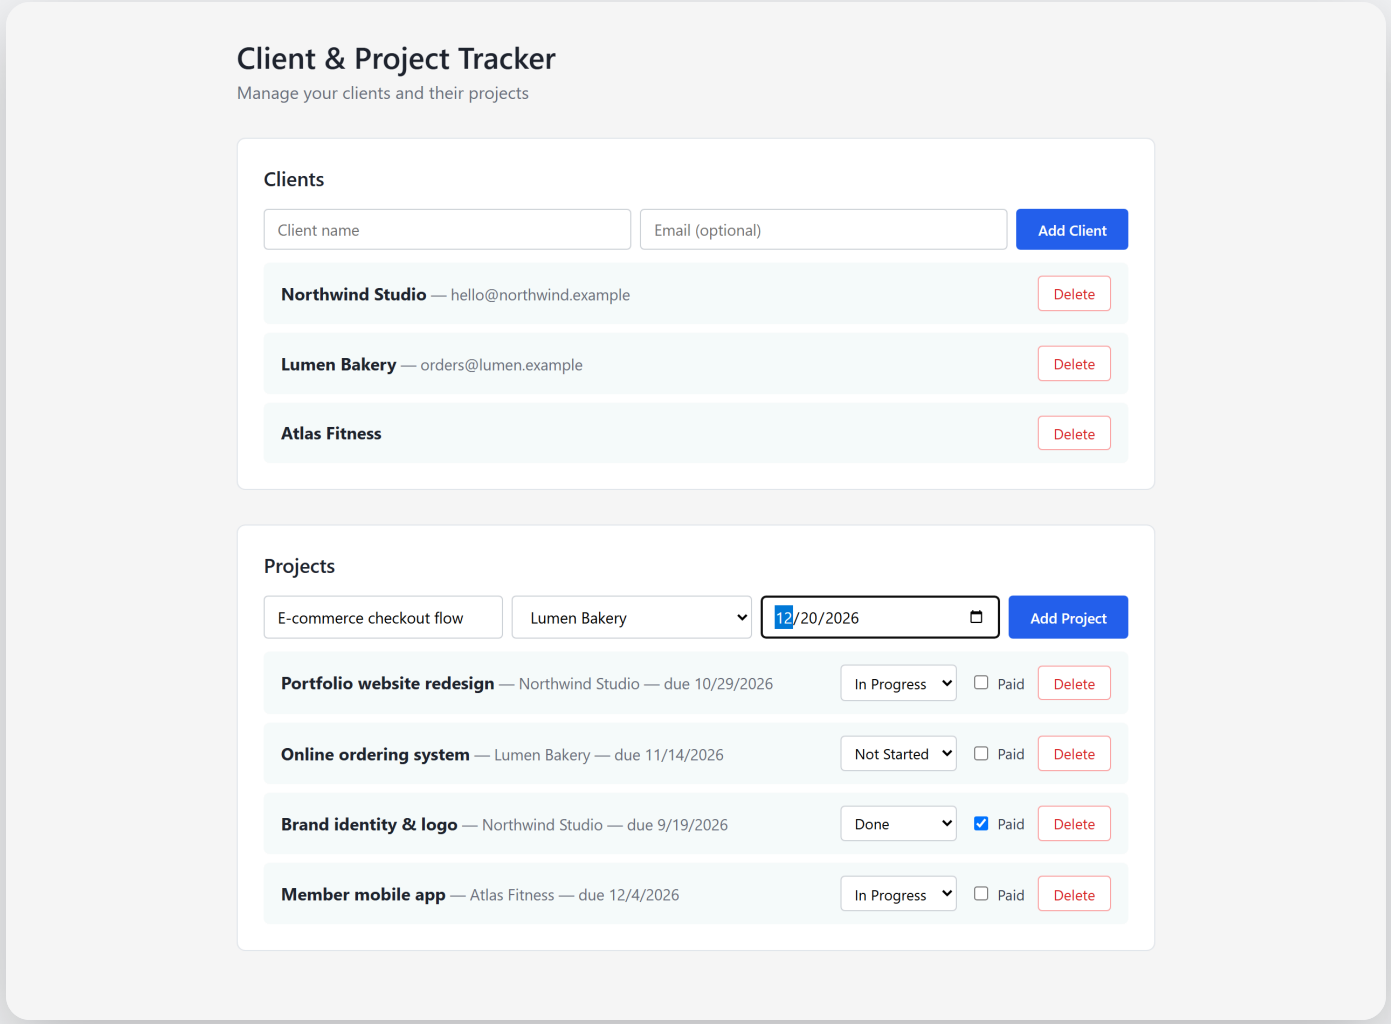

The problem & what I built

Freelancers juggle several clients at once and end up tracking deadlines, progress and payments in scattered notes. I built a small, focused tool that keeps it all in one place.

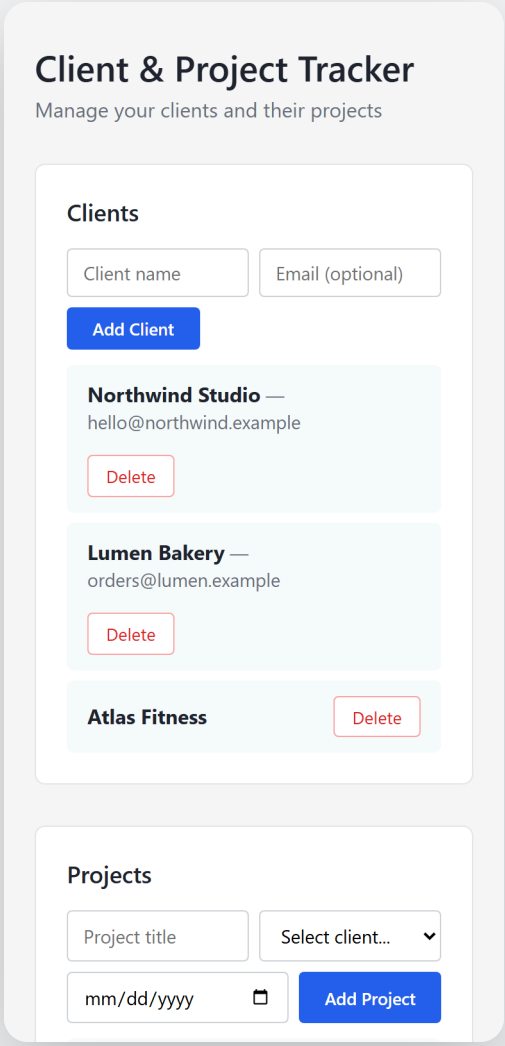

- **Client management** – add and remove clients
- **Project tracking** – link projects to clients, set deadlines
- **Inline updates** – status (Not Started / In Progress / Done) and Paid toggle
- **Data integrity** – a client with projects can't be deleted
- **Responsive** – works on desktop and mobile

Using the app

Adding a project: title, client and deadline

Mobile layout

Under the hood

- Relational model (one client → many projects) with **Prisma** migrations on **PostgreSQL**
- **REST API** (Express 5) with input validation and a central error handler returning correct status codes: 400, 404, 409, 500
- Moved from local SQLite to hosted Postgres (Neon) to make it deployable
- Per-environment **CORS**, secrets kept in environment variables
- **React** client with loading, empty and error states; ESLint clean
- Deployed: frontend on **Vercel**, API on **Render**

What I learned

How the pieces of a full-stack app fit together – schema, API, UI and deployment – and that good UX is mostly about handling the unhappy paths.

Next steps

Authentication, editing clients, filtering and sorting, automated tests.
